Real Obvious Cross Domain Solution (CDS)

This document discusses the potential deployment of Real Obvious Trusted Solutions as a Cross Domain Solution (CDS) service. This is for information purposes only and does not represent any actual CDS deployment.

As government agencies continue to grapple with complex security challenges, a critical gap remains in their ability to efficiently share sensitive information across different security domains. The traditional approach of sneakernet transfers is not sufficient to support timely collaboration and decision-making.

A networked connected Cross-Domain Solution (CDS) is urgently needed to enable fast seamless sharing and synchronization of classified and unclassified data within and between agencies with varying levels of clearance. Equally critical is the need for automation to reduce costs, minimize risks, and enhance cybersecurity in this process. Manual processes are time-consuming and prone to errors, which can have serious consequences when dealing with sensitive information.

By automating CDS workflows, government agencies can reduce the risk of human error, improve audit trails, and free up resources for more strategic activities. By leveraging Real Obvious Trusted Services government agencies can accelerate deployment of a CDS platform specifically designed to address unique needs and requirements while enhancing cybersecurity through robust access controls and monitoring capabilities.
